Increase The Adoption Of Voice Input Feature within Chat GPT (Prioritisation, Metrics & Growth)

Contributors: Avdhesh Gupta
Status: Brainstorming/**In Review**/In Development
Launching on: 13th September 2026
Resources: Milestone 1, Milestone 2, Survey and Interviews

Problem Definition - Voice adoption is low for chat GPT

Users know the voice input feature is available but are not using it:-
69.23% People says they prefer typing over speaking despite knowing the voice feature is available, 23.8% people says that they are worried about their voice data misuse, 17.95% people says chat gpt fails to understand their accent, 15.38% people says transaction if very robotic

- What is the problem?
  - **Users are not using the voice input feature for the chat GPT**
- Who is facing the problem?
  - These Customers are from the **age group 15-25 years**. They are **studying** or **preparing for a placement interview**.
- What is the business value that will be unlocked by solving the problem?
  - Solving this problem will help chatGPT to **increase its market share** in India's **growing voice economy** and as users gets more comfortable it will lead to **asking more queries** and **more token utilization and more revenue** and by **building a habit of voice** in age group of 15 year - 25 yrs **will have a long term ripple effect on business**
- How will the target users benefit if the problem is solved?
  - Voice feature will make **users' lives easier** and will **save time**. It will enable users to **multitask** and b**etter express themself** and **interact accurately**
- Why is it urgent to solve this problem now?
  - India is **smartphone and Voice ready** and data in PRD shows there is **no discovery issue.** This feature exits but there is an **engagement issue** if not addressed not **ChatGPT will lose market share to competitors**

Goals

- **Increase Voice Adoption by users to ≥ 70% Weekly**
- Increase voice Setup Completion rate by ≥ 80% weekly
- Increase the successful conversion rate by ≥ 75% weekly
- Increase the user satisfaction by ≥ 70% weekly
- Decrease the users switching from voice to Text rate ≤ 10%
- Increase the average # of voice conversation per user by ≥14 weekly
- Increase the use of pause command for longer conversations
- Introduce the wake up command with the accuracy ≥ 90% weekly

- **Functional Metrics**

Metric	Definition
% Increase Voice Adoption Rate	**# of Active Voice Users/ Total # of User *100**
% Setup Completion Rate	# of user completed the setup/ No of users started the setup * 100
% Conversation Completion Rate	# of users clicked on X icon after getting the final response / No of users started the conversation * 100
% Voice to typing switch rate	# of Switch to typing from voice / No of users started the conversation * 100
% CSAT for conversation	# of positive Responses / Total number of Responses * 100
Avg No. Of conversation in a weekly	# Total no of voice conversation in a week / Unique user using voice in a week

- **Non - Functional Metrics**

Metric	Definition
Pause Command Adoption rate	# of conversation where pause command was used / Total no of conversation started * 100
Wake up command Accuracy rate	# of times voice activated with a wake up command / # of times wake up command attempted * 100

- **Guardrail Metric**

Stickiness Ratio	Unique DAU/ Unique MAU * 100	Should not drop >5% on weekly bases

- **Why are these metrics important**

These Metrics are important as the core issue is Habit formation and Trust and also help us to address the issue of user being in charge and control the conversation above metric will help us to track the user Journey from Activation(Setup) > Using Voice > Feedback > Return Session

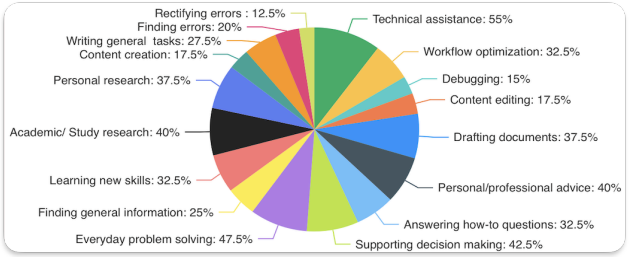

Non-Goals

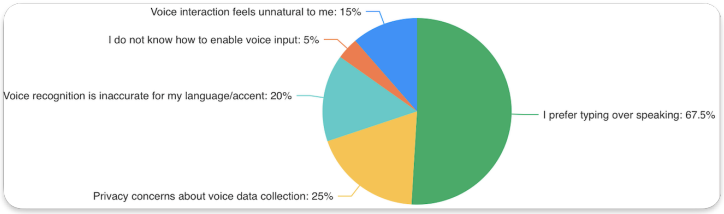

- No Change in response rate
- No Change to chat interface
- No Change in voice Icon
- Change in voice transcription format
- Multi Speaker Detection

Validation Of The Problem

As per the Quantitative and Qualitative analysis conducted, I was able to validate the below Problems.

- **Quantitative Data Results(40 Users) (Survey Link)**

69.23% users says They prefer to type over speaking	Hypothesis Validated
23.08% users says They are worried about Voice data Privacy	Hypothesis Validated
17.95% users says It Fails to understand my Language/ Ascent	Hypothesis Validated
15.38% users says Voice Interaction feels Unnatural	Hypothesis Validated

- **Qualitative Data Results(4 Users)**
  - Provide more customisable voice responses
  - Better Connectivity with other applications
  - It gives space and time for me to think and express
  - It helps me to be precise
  - I am ok to speak in English but I don't have option to edit before I submit incase I make mistake
  - I have to think and draft my question in my mind and then tell chat GPT, instead I prefer to type it out
  - I don't want people to think I am talking to myself
  - I don't want others to think I am asking dumb questions to AI

- **Insights from competitive landscape**

Voice adoption is about context, not capability.	Chat GPT should surface voice options when users are more in need of the feature as Google and tie voice to a specific job.
Conversation is the differentiator.	ChatGPT Voice enables back-and-forth conversations, interruptions and follow-ups. Position it as "talk to ChatGPT", not just "Ask ChatGPT".
India makes multilingual voices especially valuable.	Chat GPT should integrate more regional language as Google reports that >40% of its Indian language Gemini users rely on voice interactions.Hinglish + Indian languages can be a major reason to try Voice.
Wake Up Word	Chat GPT Should Introduce a Wake up Word “Hey ChatGPT” as it is used by Siri and Google assistant

Understanding The Target Audience

- **Outline of the focus segment/ segment size**

Focus Segment	Segment Size
Age Group - 15 - 25 yrs Type - Students/ Fresher (GenZ) Location - Urban/Rural Language - English/ Hindi/ Regional Users Behaviour - Frequently Used chatGPT for learning New Skill, Project research, Learn a language, Resume and interview prep, food recommendation etc.	Size - 258 Million (18.2% of total Population) Target Users - 208 Million (14.7% of total Population) Smartphone Users - 201.76 Million (14.2% of total Population) User used Voice Products - 147 Million (10.4% of Total Population)

- **Key Persona**

Name: Aagam Jain
Age and gender: 22 Yrs and Male
Occupation: Student
Social Media Usage: WhatsApp, Instagram, Youtube and snapchat
Short bio: A 22-year-old postgrad student, passionate about strategy and leadership, curious and driven, turning ideas into real-world impact through practical business challenges.
Personality traits: Passionate, Curious and fun loving

- **Current User Journeys**

User Journey 1
Click on voice icon on product page > Give Mic Permission > Select Built in Voice > Start asking questions > Click X icon once done
User Journey 2
Click on voice icon on product page > click on adjustment icon > Change the built in voice / Language > Start asking questions > Click X icon once done
User Journey 3
Click on voice icon on product page > Start asking questions > After getting response > click X icon > Transcription will be visible > Long hold the question to edit > edit > Send

- **Goals and Pain Points**

Goals	Pain Points
Want Clear/Correct answers with no frictions	Unable to hold Longer Conversation in english and also it keeps interpreting if i take pause during a long question
Wants to feel in charge and unjudged while asking queries	Unable to speak in public as it catches the background noise and answers the things that I have not asked for. Also have concerns with Voice data Breach

Want to feel Secure about my data	Voice Interaction feel robotic which makes Harder to express as there is no user experience as “Hey siri” or “Hey Google”
Wants ChatGPT to earn me trust gradually	Typing lets me think things through and empower me to edit as i go, this keeps me in control of conversation

Solutions

Our strategy is to make ChatGPT Voice from an alternative input method into a natural, trusted, and preferred way for users to interact with ChatGPT. To achieve this, we will focus on reducing the key pain points that prevent users from adopting and repeatedly using voice.

Key Features and User Benefits

- **Change Product Page message -** Instead of “Ask ChatGPT” to “Talk to ChatGPT” This change will be used inline with habit change for users who can use voice but due to a habit start typing.
- **Introducing India Specific Built In Voices** - Chat GPT has 2 extra voices for the Brazilian market and Same needs to be configured for India. This will solve problems of user feeling translation is robotic
- **Introducing voice signature** - Users can record the voice signature during setup so that chat gpt can recognise and focus on the users voice during the background disturbance.
- **Introducing Accent Training** - As users continue to speak with chat GPT, it will use a hardware technology name NPU (Neural Processing Unit) to train itself on individual user accent.This will ultimately solve the problem of the user “Unable to recognise my accent”
- **Add Safety Disclaimer -** Display an “end-to-end encryption” message after setup and on chat window. This will increase the confidence of the user over voice data security**.**
- **Introducing Wakeup word** - Users can use the wake up word “Hey chatGPT”. This will enable users to activate voice conversation Handsfree.
- **Introducing Wait Word** - Users can use the Wait word (“Wait for my cue”). This will enable users to stop chatGPT from giving interruptions when expressing a long question with few pauses. It will also give users a sense of control.
- **Introducing the Live Transcription -** ChatGPT will show the live transcription when the user is speaking. This will give users a sense of confidence while speaking but it will have no capability to edit real time as it needs to be done after conversation as usual.

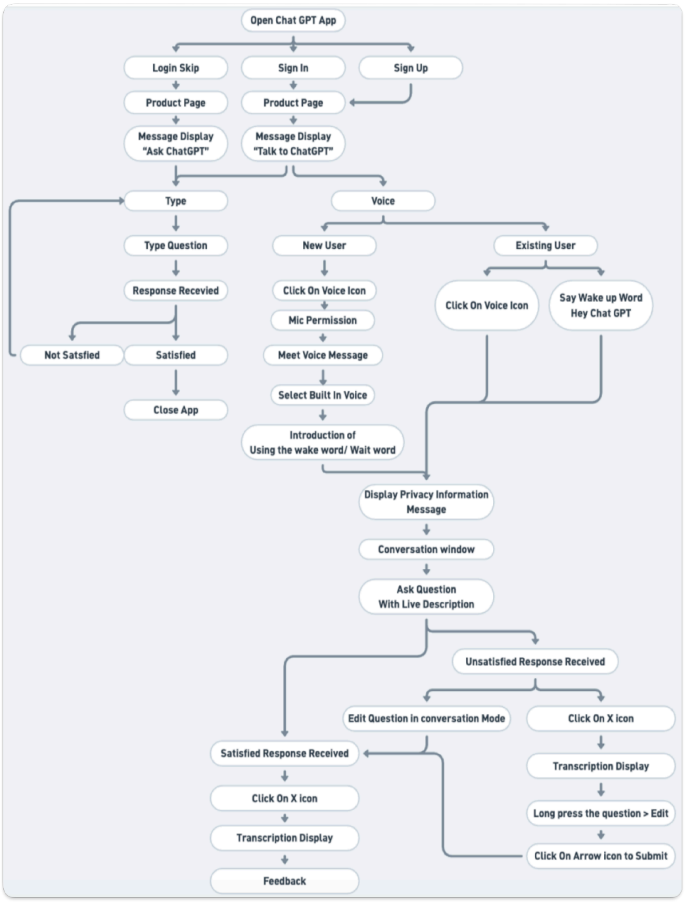

Solution prioritization Plan

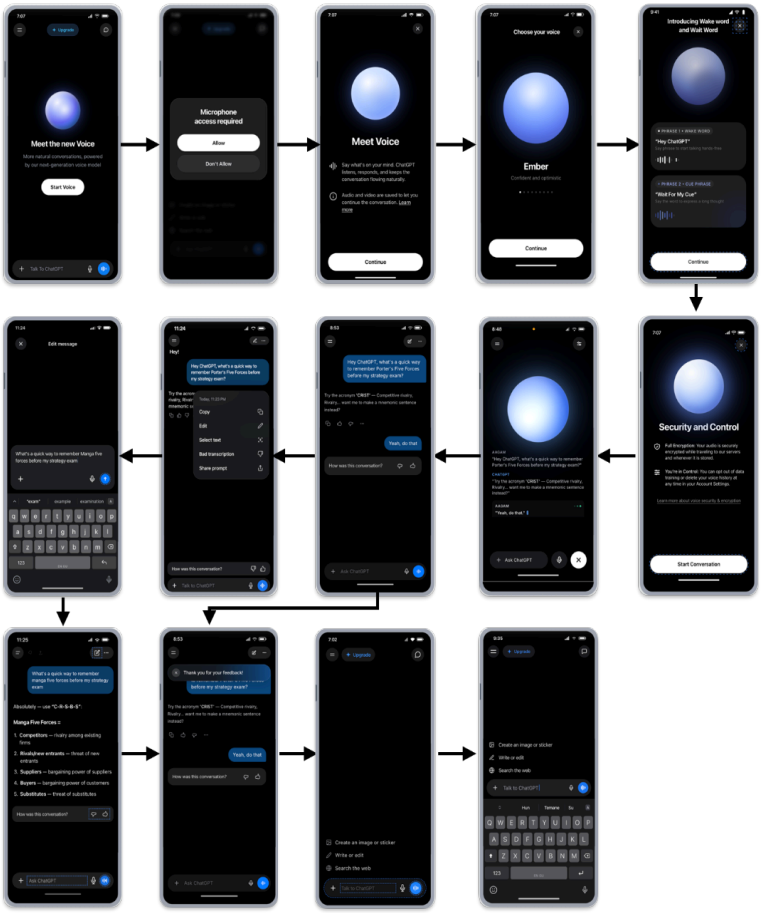

Phase 1 - Remove Barriers to Built Trust	Phase 2 - Build Advance Intelligence
• “Ask ChatGPT” > “Talk To ChatGPT”	• Introducing Voice Signature
• Introducing Live Transcription	• Introducing Personalized Accent Training
• Disclaimer of Privacy Messaging	• Introducing 2 Indian new Built in Voices
• Introducing Wake up / Wait word	

Key Logic

The key logic behind the proposed enhancements is to reduce the key pain points that are stopping users from using the Voice feature. **Live Transcription** will show users what ChatGPT is understanding while they are speaking and give them more confidence during the conversation. **Wake/Wait Word** will allow users to Activate Voice and take long pauses during longer conversations without ChatGPT giving an unwanted response. **Safety Disclaimer** will provide users with information about Voice data privacy and help increase trust towards the feature. Advanced features such as **Voice Signature, Accent Training and Introducing 2 New Built In Voices** will require additional logic and will be introduced in Phase 2 based on the results and learnings from Phase 1.

User Journey and Wireframe (Prototype Link)

Launch Readiness (Phase 1)

- Key Milestones - PRD Approval (Week 1) > Design complete (Week 2) > Development complete (Week 6) > QA Testing (Week 7) > Dogfooding (Week 8) > Bug Fixing(Week 9) > Launch(Week 10)
- Internal Stake Holders - Product Manager, Designers, Developers, Quality Analyst, Support Team and Leadership
- A/B Testing:
    - Group A - Current Flow
    - Group B - Phase 1 Deployment (1,00,000 User)
    - Success Metric - # of Active Voice Users/ Total # of User *100
        - Goal - In Group B Voice usage to increase for >50%

Open Questions & Decisions Taken

- Can Voice data be made End-to-End Encrypted - Need to be evaluated
- Which Indian voices needs to be considered for Phase-2 enhancement “Introducing 2 new built in voices” - Need to be evaluated
- Will “Personalized Accent Training” will work on all Low to High End Phones - Need to be evaluated
- Introducing “Voice Signature” feature is it technically feasible - needs to be evaluated

Descoped

- Change in response rate
- Change to chat interface
- Change to voice icon
- Change in voice transcription format
- Multi-Speaker Detection

Trade Offs

- Building trust in phase 1 over advance intelligence
- Kept editing the voice message as per current flow and did not add it to live transcription
- Going for A/B testing first and then to full scale this will delay the launch by 2 weeks before full release
